This near full-length cDNA clone, designated TaSSS, codes for a soluble starch synthase (see AAW23837) of summer wheat (cv. Florida). It was isolated from a phage cDNA library of 21-day-old wheat caryopses by screening with a PCR fragment derived from rice soluble starch synthase (see also AAV01529-30). A second clone (see AAV01528), coding for wheat granule-bound starch synthase (see AAW23938) is also claimed. These isolated nucleic acids can be inserted into vectors

                                                                                                                                                                                                                                                                                      9
for production of transgenic plants, particularly starch-producing plants, specifically wheat. Use of the isolated nucleic acids, or of antisense sequences, allows starch metabolism to be regulated in transgenic plants. Overexpression may result in improved crop yield, while modification of starch in planta may eliminate the need for subsequent chemical/physical modification. Plants with alltered levels of the various isoforms of starch synthase will produce starch of different chain length, amylose/amylopectin ratio,
                                                                                                 degree of branching, phosphate content, gelatinisation behaviour, granule size and shape, viscosity etc. The starch produced by such plants is useful particularly in foods or to produce packaging materials or disposable goods, as well as in any other known use of
                                                                                                                                                                                                                                                                                                                                                                                                            ggtcctctgataaaaactatgcaaaggcattatacactgcgaagcacattaagattccat

~

This invention describes a novel protein (I) with the activity of wheat starch synthase. Transgenic plants, specifically wheat, that contain (I) are used for production of starch, used particularly in foods, particularly baked and pastry goods and for making packaging materials or disposable items. Starch may also be used as starting materials for glucose or glucon components (e.g. for fermentation or further chemical conversion); in paper and pulp production, as adhesives, in textiles, on preparation of gypsum-based building materials, as soil stabilizer, as wetting agent etc. in fertilizer and plant-protection compositions, as binder (in pharmaceuticals, cometics, coal briquetting and casting sand), as flocculant in soil or coal slurries, as rubber and leather additives, and for production of synthetic polymers, e.g. polyurethane films. Transgenic plants with increased/decreased production of (I) produce starches with altered physical and/or chemical properties such as amylosectin ratios, degree of branching, mean chain length, properties, or starch grain size or structure. This sequence encodes the product of the synthase isolated from wheat (Triticum aestivum L. cv. producing for synthase activity, useful g materials -Claim 1b; Page 15-19; 24pp; German th starch s packaging r WPI; 2000-024508/03 P-PSDB; AAY50818. enzyme with foods and pa g

The methods and products can be used for targeting expression specifically to the endosperm of the seeds of cereal plants such as wheat or barley. They can be used for the expression of e.g. antisense sequences of granule-bound synthase (GBSS), SBE II, low mol. wt. glutenin, grain softness protein I, bacterial isoamylase, bacterial glycogen synthase, and wheat high mol. wt. glutenin BxI7. They can be used for modifying the characteristics of starch produced by a plant. The present sequence represents the wheat SSS I cDNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Starch biosynthetic pathway; cereal plant; enzyme; SBE; SSS; DBE; GBS; starch branching enzyme; starch scalable synthase; debranching enzyme; endosperm; wheat; barley; granule-bound synthase; glutenin; starch; grain softness protein I; bacterial isoamylase; glycogen synthase;

```
This near full-length cDNA clone, designated TaSSS, codes for a soluble starch synthase (see AAW23837) of summer wheat (cv. Florida). It was isolated from a phage cDNA library of 21-day-old wheat caryopses by screening with a PCNF fragment derived from rice soluble starch synthase (see also AAV01529-30). A second clone (see AAV01528), coding for wheat granule-bound starch synthase (see AAW23938) is also claimed. These isolated nucleic acids can be inserted into vectors
                                                       2483
                                                                        2460
                                                                                        2543
                                                                                                                        2603
Nucleic acid encoding starch synthase enzymes from wheat - for transgenic plants that produce modified forms of starch, useful e. In foods, or for production of packaging materials and disposable
                                                                                        ij
                                                                                                                                                                                                                                                                                                                                                                                                                                            C, Kossmann

for production of transgenic plants, particularly starch-producing plants, specifically wheat. Use of the isolated nucleic acids, or of antisense sequences, allows starch metabolism to be regulated in transgenic plants. Overexpression may result in improved crop yield, while modification of starch in planta may eliminate the need for subsequent chemical/physical modification. Plants with altered levels of the various isoforms of starch synthase will produce starch of different chain length, amylose/amylopectin ratio, degree of branching, phosphate content, getafithisation behaviour, granule size and shape, viscosity etc. The starch produced by such plants is useful particularly in foods or to produce packaging materials or disposable goods, as well as in any other known use of

The present sequence is the corn soluble starch synthase (SSI) composite gene. This was used in the construction of plasmid pSS31 for the generation of an antisense construct for suppression of SSI expression for corn. The starch fine structure derived from a grain of the cereal crop can be altered in the transformed cereal crop by changes in amylose to amylopectin ratio, amylopectin fine structure, increased abundance of very short amylopectin chains and in the degree of polymerisation of amylose. These modifications can be created by controlling the expression of non-GBSSI (non-granule bound starch synthase) in transgenic plants. Altered starches are useful in foods, paper, plastics

The present sequence is the corn soluble starch synthase (SSI) DNA sequence comprising the entire SSI coding region and a 3' UTR fragment proserted into plasmid pSS65-C11. The chimmeric gene containing the zein promoter followed by the 3'UTR is used as a sense construct for preparation of transgenic corn expressing altered starch structure. The starch fine structure derived from a grain of the cereal crop can be altered in the transformed cereal crop by changes in amylose to amylopectin ratio, amylopectin fine structure, increased abundance of wery short amylopectin fine structure, increased abundance of amylose. These modifications can be created by controlling the expression of non-GBSI (non-granule bound starch synthase) in transgenic plants. Altered starches are useful in foods, paper, plastics

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents an isolated nucleic acid molecule which has been isolated and comprises a nucleotide sequence encoding a polypeptide having soluble starch synthase (SSS) activity, where the polypeptide having soluble starch synthase (SSS) activity, where the molecule can be encoded by a maize gene. The isolated nucleic acid molecule can be used to produce transgenic plants with altered starch production. The transgenic plants produced using the nucleic acid molecule have an enhanced ability to produce structurally-altered star
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Isolated nucleic acid molecule, used to produce transgenic plants - comprises nucleotide sequence encoding polypeptide having soluble starch synthase activity, where polypeptide is encoded by maize gene
                                                                                                                                                                                                                                                                                                                                                                                 synthase;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The soluble rice starch synthetic enzyme gene has, at the N-terminal, the transit peptide that is required for the transition of this enzyme to the amyloplast. Introduction of this gene into the rice protoplast augments the extraction of soluble rice starch synthetic enzyme. The transit peptide coding sequence can be used for the efficient transition of any protein into amyloplasts.

soluble starch synthase (SSS). They were isolated from a maize inbred line W64A library by screening with a probe (AAT67288) based on pea SSS, rice SSS and maize GBSS. The cDNAs can be used to produce plants with an increased capacity for producing starch, or a capacity to produce starch with an altered fine structure. They can also be used to isolate the corresponding genomic sequences from crop plants, to determine the contribution of the SSS gene to the net regulation of starch biosynthesis, and to modify the levels of starch produced by the plant. Transgenic plants (esp. maize) can be used to produce hybid plants which have higher rates of starch synthesis at temperatures above the normal optimum.

It can be used in the production of a hybrid polypeptide comprising a starch-encapsulating region (SER) fused to a payload protein. The hybrid polypeptide can be used to modified starches comprising the payload protein, selected fie.g. hormones, growth factors, antibodies, enzymes, dyes, immunoglobulins, etc. The modified starch can also be used to provide grain feeds enriched in amino acids. By encapsulaithe payload protein in starch, it is more resistant to degradation by stomach acids.

The specification describes a method for the production of non-11ycogen-11ke polysaccharides in a host. The method comprises transforming a host, suitable for fermentation, with genes encoding starch- or glycogen synthesis enzymes, and fermenting the transformants. The specification also describes hosts transformed with a gene active in glycogen synthesis and at least one non-starch branching gene, involved in production of amylopectin or amylose in its original host. The method is used to produce plant-11ke starches by fermentation and non-food applications of starch. The present sequence is used in Producing non-glycogen-like polysaccharides in bacteria, fungi or plants - transformed with genes for enzymes involved in starch or glycogen synthesis allows fermentative production of starches with English the course of the invention.                                                                                                                                                                                                                                                                                                                                                               The sequence is that of the starch synthase coiding region from PEXS2. It can be used in the production of a hybrid polypeptide comprising a starch-encapsulating region (SER) fused to a payload protein. The hybrid polypeptide can be used to make modified starches comprising the payload protein, selected from, immunoglobulins, etc. The modified starch can also be used to provide grain feeds enriched in amino acids. By encapsulating degradation by stomach acids.

The present sequence is the corn soluble starch synthase (SSI) DNA sequence inserted into plasmid pSS42. Chimeric gene of pSS42 was cloned into the vector pKSI7 for the generation of an antisense construct for suppression of SSI expression in corn. The starch fine structure derived from a grain of the cereal crop can be altered in the transformed cereal structure, increased abundance of very short amylopectin fine structure, increased abundance of very short amylopectin chains and in the degree of polymerisation of amylose. These modifications can be created by controlling the expression of non-GBSSI (non-granule bound starch synthase) in transgenic plants. Altered starches are useful in foods, paper, plastics or adhesives.

The present sequence is the corn soluble starch synthase (SSI) DNA sequence comprising the SSI coding region of amino acids 1-494 inserted into plasmid pSS64-C5. The chimeric gene containing the zein promoter followed by the SSI gene fragment is used as a sense construct for preparation of transgenic corn expressing altered starch structure. The starch fine structure derived from a grain of the cereal crop can be altered in the transformed cereal crop by changes in amylose to amylopectin fine structure, increased abundance of wery short amylopectin fine structure, increased abundance of wery short amylopectin chains and in the degree of polymerisation of amylose. These modifications can be created by controlling the expression of non-GBSI (non-granule bound starch synthase) in transgenic plants. Altered starches are useful in foods, paper, plastics
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 541
